## 1.1 Unit 1

### Problem 1

The molar mass of  $C_9H_8O_4$  is  $1.008 * 8 + 12.01 * 9 + 16.00 * 4 = 180.2 \frac{g}{mol}$

$$7.89kg \times \frac{1g}{10^{-3}kg} \times \frac{1mol}{180.2g} = 43.8mol \quad (1)$$

### Problem 2

(b), the tallest peak of the graph is the one at  $64u$ .

### Problem 3

In one mole of  $C_{13}H_{18}O_2$  is  $206.31g$ .

$$1mol C_{13}H_{18}O_2 \times \frac{13mol C}{1mol C_{13}H_{18}O_2} \times \frac{12.01g}{1mol C} = 156.31g \quad (2)$$

Thus, the percent composition by weight is  $\frac{156.31}{206.31} = 75.764\%$

### Problem 4

Take  $100g$  of the substance such that there are  $32.38g$  sodium,  $22.65g$  sulfur, and  $44.99g$  oxygen.

$$\begin{aligned} 32.38g Na \times \frac{1mol Na}{22.99g} &= 1.408mol Na \\ 22.65g S \times \frac{1mol S}{32.07g} &= 0.7063mol S \\ 44.99g O \times \frac{1mol O}{16g} &= 2.812mol O \end{aligned} \quad (3)$$

Take the ratio of each compound with the smallest quantity.

$$\begin{aligned} S : \frac{0.7063}{0.7063} &= 1 \\ Na : \frac{1.408}{0.7063} &= 2 \\ O : \frac{2.812}{0.7063} &= 4 \end{aligned} \quad (4)$$

Therefore, the empirical formula is  $Na_2SO_4$

### Problem 5

$$1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6 5s^2 4d^{10} 5p^6 6s^2 4f^{14} 5d^{10}$$

### Problem 6

Be. The peak location of the peak on the x-axis means that there is less binding energy for the electrons in element X. Be has fewer protons and both electrons are in the same shell, so its peak must belong to Be.

### Problem 7

- The electronegativity increases from left to right across a period. This is because if a valence shell of electrons is less than half full then it requires less energy to lose an electron than gain one. If the valence shell of electrons is more than half full, it is easier to pull an electron into the valence shell. The electronegativity decreases from the top to the bottom of a group. This is because there is a greater atomic radius lower on the group.
- The ionization energy increases from left to right in a period. This is because of greater valence shell stability also because of smaller atomic radius. The ionization energy also decreases from top to bottom of a group. This is because of greater electron shielding and greater atomic radius.
- Atomic radius decreases from left to right within a period. This is because there are more protons to the right of the period. Atomic radius increases from top to bottom within a group. This is because of electron shielding and there are more electron shells in the atom.

## 1.2 Unit 2

### Problem 8

The ionic character increases the greater the electronegativity difference. In this case, Na and O had the greatest electronegativity difference.

### Problem 9

(c)  $\text{Cl} - \text{F} > \text{H} - \text{I} > \text{Se} - \text{N}$

### Problem 10

$\text{Cs}^+$  has a larger atomic radius than  $\text{K}^+$ . So the distance between the cation and anion is greater than in CsF than in KF

### Problem 11

Most metallic elements form crystalline solids at room temperature. Their bonds are metallic bonds due to electrostatic attraction between metal cations and delocalized electrons.

**Problem 12**

- Substitutional alloys. These alloys form when one atom of a similar size to the host metal replaces an atom of the host metal. The substitute atom must be of similar size. These alloys have good thermal and electrical conductivity.
- Interstitial alloys. These alloys are formed when smaller atoms fill in the gaps between the larger host atoms. This makes the metal harder and less malleable.

**Problem 13****Problem 14****Problem 15****Problem 16**

All formal charges of  $\text{CH}_3\text{COOH}$  and  $\text{CO}_2$  are zero.

**Problem 17**

The electron geometry is tetrahedral. The molecular geometry is trigonal pyramidal. Hybridization of N atom is  $sp^3$  since it has tetrahedral electron geometry.

**1.3 Unit 3****Problem 18**

Dipole-dipole and London dispersion forces. The  $\text{C} - \text{O}$  bond is polar and the molecule is asymmetrical so it is polar. There are no  $\text{H} - \text{F}$ ,  $\text{H} - \text{O}$ , or  $\text{H} - \text{N}$  bonds, so there is no hydrogen bonding.

**Problem 19**

Condensation. Both have no regular arrangement, the one on the left is separated by the one on the right is close together, so the molecules are transitioning from gas to liquid.

**Problem 20**

(a) As you increase the temperature, the average kinetic energy or speed increases as well.

(b)  $n_1 = n_2$  and  $V_1 = V_2$ , so  $P_1V_1 = n_1RT_1$  and  $P_2V_2 = n_2RT_2$ .  $\frac{P_2V_2}{RT_2} = \frac{P_1V_1}{RT_1} \implies P_2 = \frac{P_1T_2}{T_1} = \frac{0.7 \times 425}{299} = 0.99 \text{ atm}$

(c) As the temperature increases, the average kinetic energy increases, so the molecules undergo more collisions with the walls of the container.

**Problem 21**

$$60.3g \times \frac{1 \text{ mol Ba(OH)}_2}{171.35g} \times \frac{2 \text{ mol OH}^-}{1 \text{ mol Ba(OH)}_2} * \frac{1}{1.75L} = 0.402M$$

**Problem 22**

The photoelectric effect occurs when light of a certain minimum frequency/energy hits the surface of a metal and electrons are ejected.

**1.4 Unit 4****Problem 23****Problem 24**

The oxidation reaction:

The reduction reaction:

Add the reactions together:

### Problem 25

### Problem 26

Chemical processes are characterized by changes in intramolecular forces, while physical processes are characterized by changes only in intermolecular forces.

### Problem 27

Find the limiting reactant:

$$\begin{aligned} 36.0 \text{ gH}_2\text{O} * \frac{1 \text{ molH}_2\text{O}}{18.02 \text{ gH}_2\text{O}} * \frac{1 \text{ molFe}_3\text{O}_4}{4 \text{ molH}_2\text{O}} &= 0.49945 \text{ molFe}_3\text{O}_4 \\ 67.0 \text{ gFe} * \frac{1 \text{ molFe}}{55.85 \text{ gFe}} * \frac{1 \text{ molFe}_3\text{O}_4}{3 \text{ molFe}} &= 0.39988 \text{ molFe}_3\text{O}_4 \end{aligned} \quad (5)$$

Therefore, the limiting reactant is  $\text{Fe}_3$

Find how much iron oxide is produced: Use the limiting reactant

$$0.39988 \text{ molFe}_3 * \frac{231.55 \text{ gFe}_3\text{O}_4}{1 \text{ molFe}_3} = 92.6 \text{ gFe}_3\text{O}_4 \quad (6)$$

Find how much excess reactant is left over:

$$67.0 \text{ gFe} * \frac{1 \text{ molFe}}{55.85 \text{ gFe}} * \frac{4 \text{ molH}_2\text{O}}{3 \text{ molFe}} * \frac{18.02 \text{ gH}_2\text{O}}{1 \text{ molH}_2\text{O}} = 28.8 \text{ gH}_2\text{O} \quad (7)$$

28.8 grams of water is used out of 32.0 grams. So there is 7.2 grams left over of the excess reagent.

### Problem 28

$$1.5 \times 10^3 \text{ mol}$$

**Problem 29**

$$\begin{aligned} \text{CH}_4 \quad \text{rate} &= \frac{-\Delta[\text{CH}_4]}{\Delta t} \\ \text{O}_2 \quad \text{rate} &= \frac{-1}{2} \frac{\Delta[\text{O}_2]}{\Delta t} \\ \text{CO}_2 \quad \text{rate} &= \frac{\Delta[\text{CO}_2]}{\Delta t} \\ \text{H}_2\text{O} \quad \text{rate} &= \frac{1}{2} \frac{\Delta[\text{H}_2\text{O}]}{\Delta t} \end{aligned}$$

**Problem 30**

$$10 \frac{M}{s}$$

**Problem 31**

$$\begin{aligned} \frac{(0.04-0.1)M}{125ms} \times \frac{1ms}{10^{-3}s} &= -0.48 \frac{M}{s} \\ \text{rate} &= -\frac{1}{2} \times -0.48 = 0.24 \frac{M}{s} \end{aligned}$$

**Problem 32**

When concentration of  $B$  is held constant and the concentration of  $A$  is tripled, the initial rate is multiplied by 9 so the order with respect to  $A$  is 2. The order with respect to  $B$  is 0 because nothing changes when the concentration is increased. Thus the rate law is

$$\text{rate} = k[A]^2[B]^0 = k[A]^2$$

$$1.0 \times 10^{-2} = k \times 0.1^2 \implies k = 1.0 \frac{1}{ms}, \text{ thus } \text{rate} = [A]^2$$

**Problem 33**

$$\ln[A]_t = -kt + \ln[A]_0$$

$$\ln[A]_t = -(4.8 \times 10^{-4})(825) + \ln(0.0165)$$

$$[A]_t = e^{-4.50} = 0.0111M$$

Half-life:

$$\ln\left(\frac{1}{2}[A]_0\right) - \ln[A]_0 = -kt$$

$$\ln\left(\frac{1}{2}\right) = -kt$$

$$t = \frac{\ln(2)}{k}$$

**Problem 34**

$$\begin{aligned} k &= 4.0 \times 10^{-4} \frac{1}{Ms} = 35 \frac{1}{M \times \text{days}} \\ \frac{1}{[A]_t} &= 35 * 6 + \frac{1}{0.1} \implies [A]_t = 4.5 \times 10^{-3} \end{aligned}$$

**Problem 35**

$$\frac{1}{0.085M} = 35t + \frac{1}{0.1M} \implies t = 0.05 \text{ days}$$

**Problem 36**

$2\text{H}_2\text{O}_2 \longrightarrow 2\text{H}_2\text{O} + \text{O}_2$  The rate determining step is the slow reaction, so  
 $rate = k[\text{H}_2\text{O}_2][\text{I}^-]$   
 $\text{I}^-$  is the catalyst.  $\text{IO}^-$  is the intermediate.

**Problem 37**

Overall:  $2\text{NO} + 2\text{H}_2 \longrightarrow 2\text{H}_2\text{O} + \text{N}_2$   
 Rate determining step:  $rate = k[\text{N}_2\text{O}_2][\text{H}_2]$   
 Fast equilibrium: rate forward = rate back  $\implies [\text{N}_2\text{O}_2] = \frac{k_f}{k_r}[\text{NO}]^2$   
 Thus,  $rate = \frac{k_f k_r}{k_r}[\text{NO}]^2[\text{H}_2]$

**1.5 Unit 6: Thermodynamics****Problem 38**

$$50g\text{H}_2\text{O} \times \frac{1\text{molH}_2\text{O}}{18.01g\text{H}_2\text{O}} \times \frac{6.022 \times 10^{23}\text{H}_2\text{O}}{1\text{molH}_2\text{O}} \times \frac{2\text{O}-\text{H}}{1\text{H}_2\text{O}} \times \frac{1.8 \times 10^{-9}\text{cal}}{1\text{O}-\text{H}} \times \frac{4.184J}{1\text{cal}} \times \frac{1kJ}{10^3J} = 2500kJ$$

**Problem 39**

$$q_{water} = 7.3 \times 100 \times 4.184$$

$$q_{water} = -q_{metal}$$

$$q_{metal} = C_{metal}(27.3 - 100) * 120 \implies C_{metal} = 0.350 \frac{J}{g^\circ C}$$
